

# New Road-Middleburg 115 kV Electric Transmission Rebuild Project

Fauquier, Loudoun and Prince William Counties

At Dominion Energy, we are committed to providing safe, reliable electricity to our neighbors. The electric transmission line that runs from our New Road Substation to our Middleburg Substation is at the end of its service life and needs to be rebuilt to maintain reliability for the more than 9,000 customers it serves.

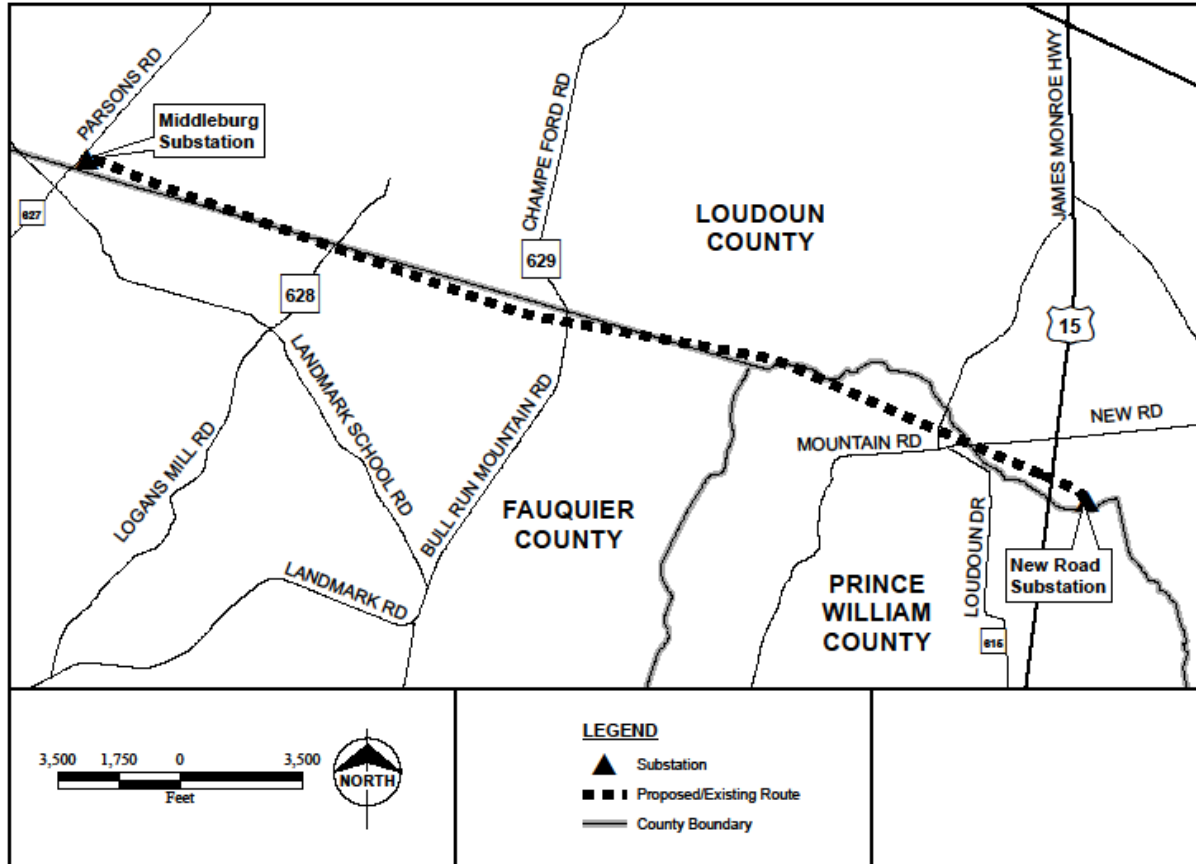

**Overview:** This 115 kilovolt (kV) transmission line runs for 5.8 miles through Fauquier, Loudoun and Prince William counties. It was constructed in 1953 using wooden H-frames and has been well maintained throughout the years, but after more than 60 years of service, the structures and related components need to be replaced. The current average structure height is 54 feet and the average height of the newly-proposed structures is 59 feet. *These numbers are subject to change with final engineering.* We will use the existing right of way corridor as we rebuild this line. During the rebuild, a temporary transmission line will be built along the existing right of way to provide electricity to customers normally served by this line.

<b>Anticipated Schedule</b>	
<b>Fourth Quarter 2018</b>	Planning discussions with counties
<b>First Quarter 2019</b>	Announce project to public
<b>Late Summer 2020</b>	Begin preconstruction activities
<b>Fall 2020</b>	Begin line construction activities
<b>Late 2021</b>	Complete project
